SALES PERFORMANCE DASHBOARD PROJECT REPORT

SUBMITTED BY,

CHINMAYA A S

INTRODUCTION

This project focuses on creating an interactive **Sales Performance Dashboard using Tableau**. The objective of the dashboard is to analyze sales data and present meaningful business insights related to sales, profit, regions, categories, and salesperson performance. The dashboard is designed to be clean, professional, and easy to understand for business users.

OBJECTIVES

The main objectives of this project are:

- To visualize overall sales performance using KPIs.
- To analyze sales across different product categories and regions.
- To identify top-performing salespersons.
- To calculate order processing duration using calculated fields.
- To apply conditional logic for business-specific analysis.
- To enable hierarchical drill-down analysis for better decision-making.

TOOLS AND TECHNOLOGIES USED

- **Tool:** Tableau Desktop
- **Language:** Tableau Calculated Fields
- **Data Source:** Sales dataset (CSV/Excel)

TASKS

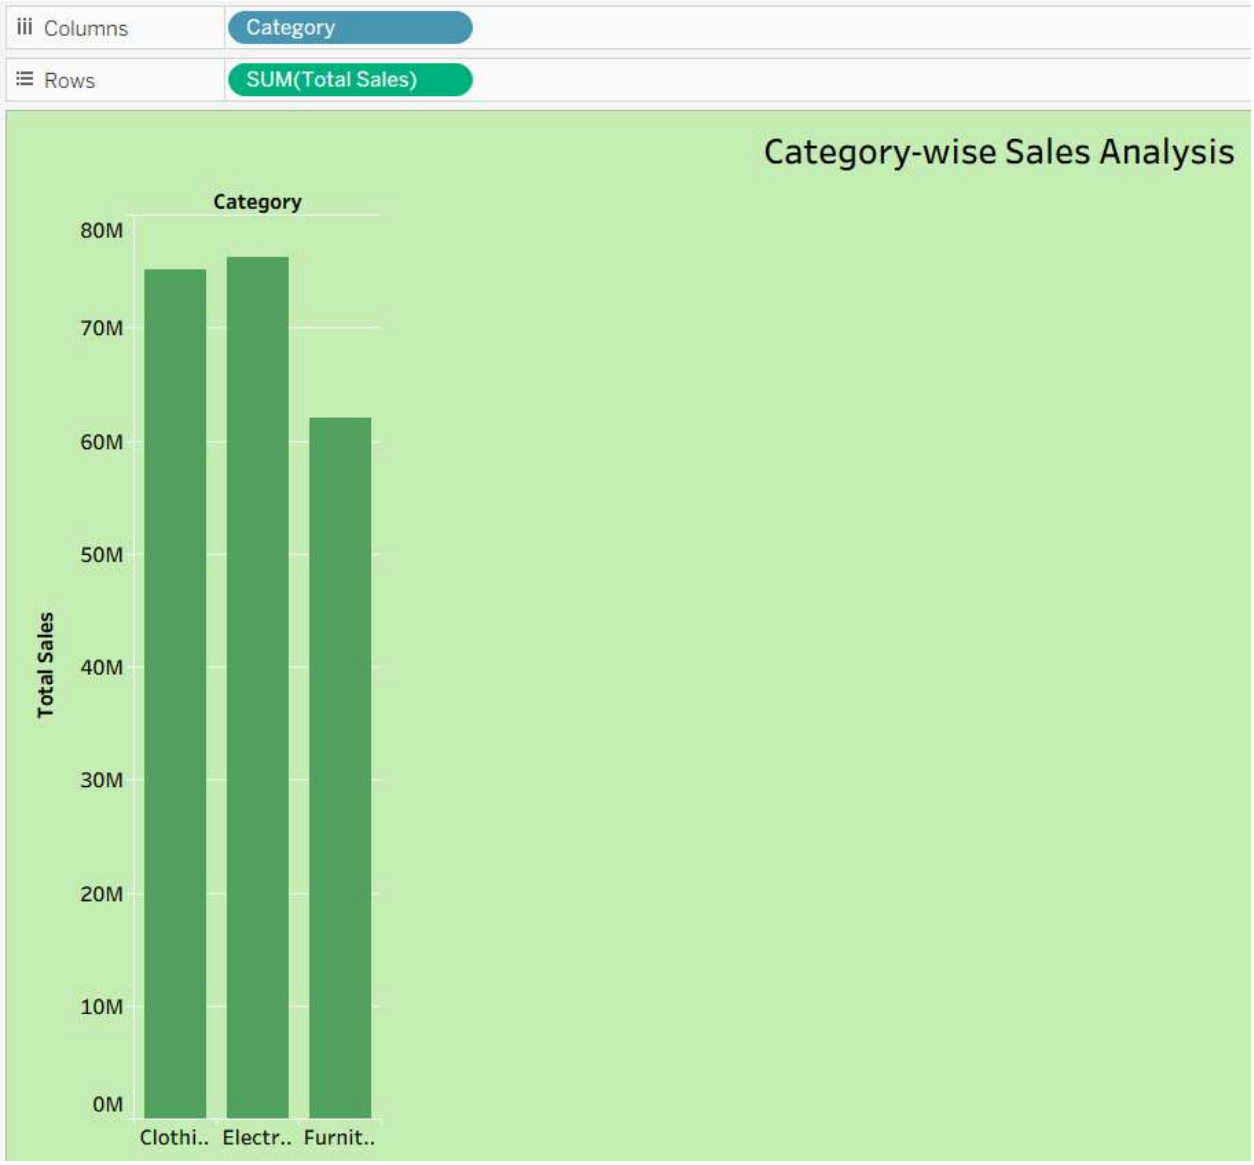
Sales Dashboard Creation

A dashboard page was created with:

- Heading: **Sales Analysis Dashboard**
- Proper alignment of visuals
- Clean and professional formatting
- Well-structured layout for better readability

Category-wise Sales Analysis

Category-wise Total Sales were displayed using a **bar chart**.
This visualization helps in comparing the contribution of each category to overall sales.



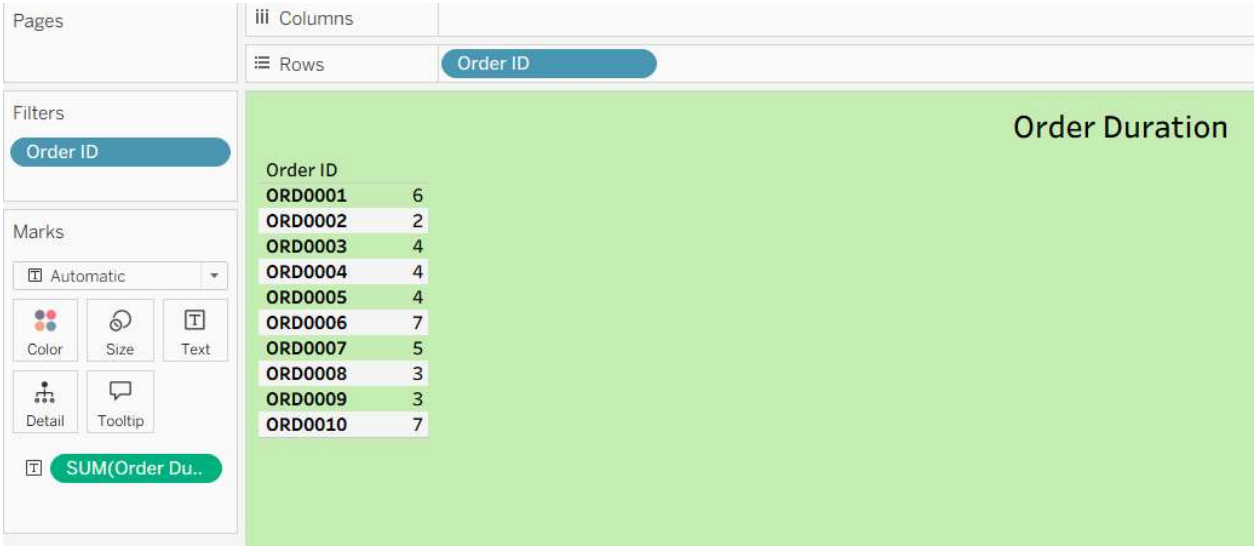
Calculated Column – Order Duration

A calculated field was created to find the duration (number of days) between Order Date and Ship Date.

Formula used:

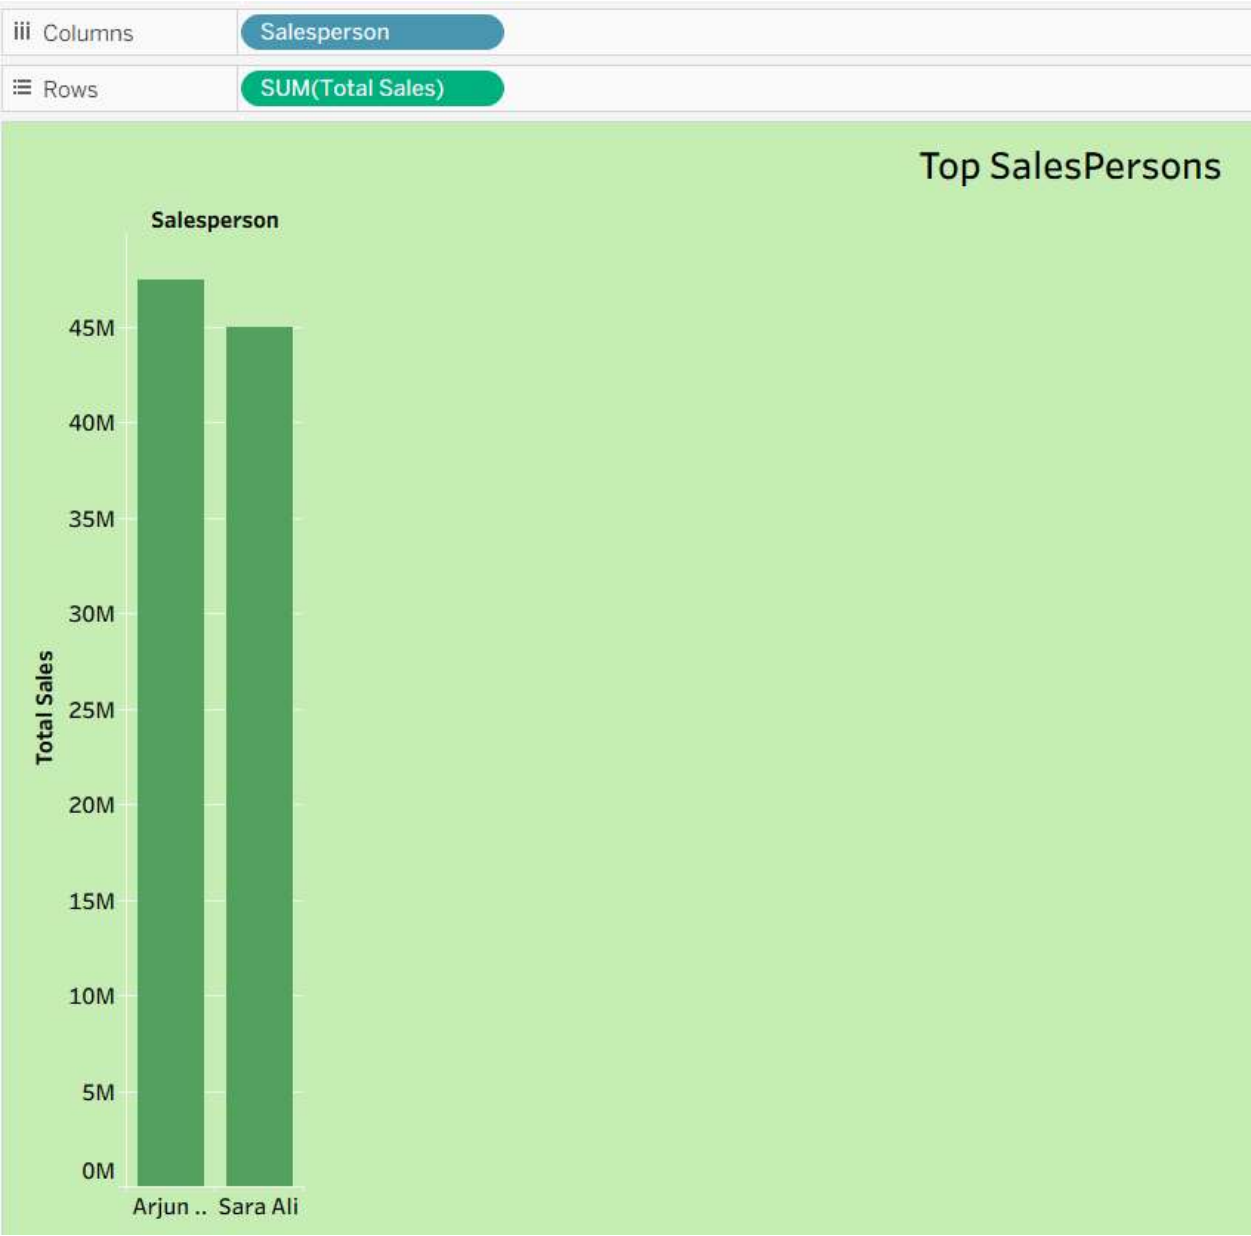
```
DATEDIFF('day', [Order Date], [Ship Date])
```

The result was displayed along with the first 10 Order IDs in a table format.



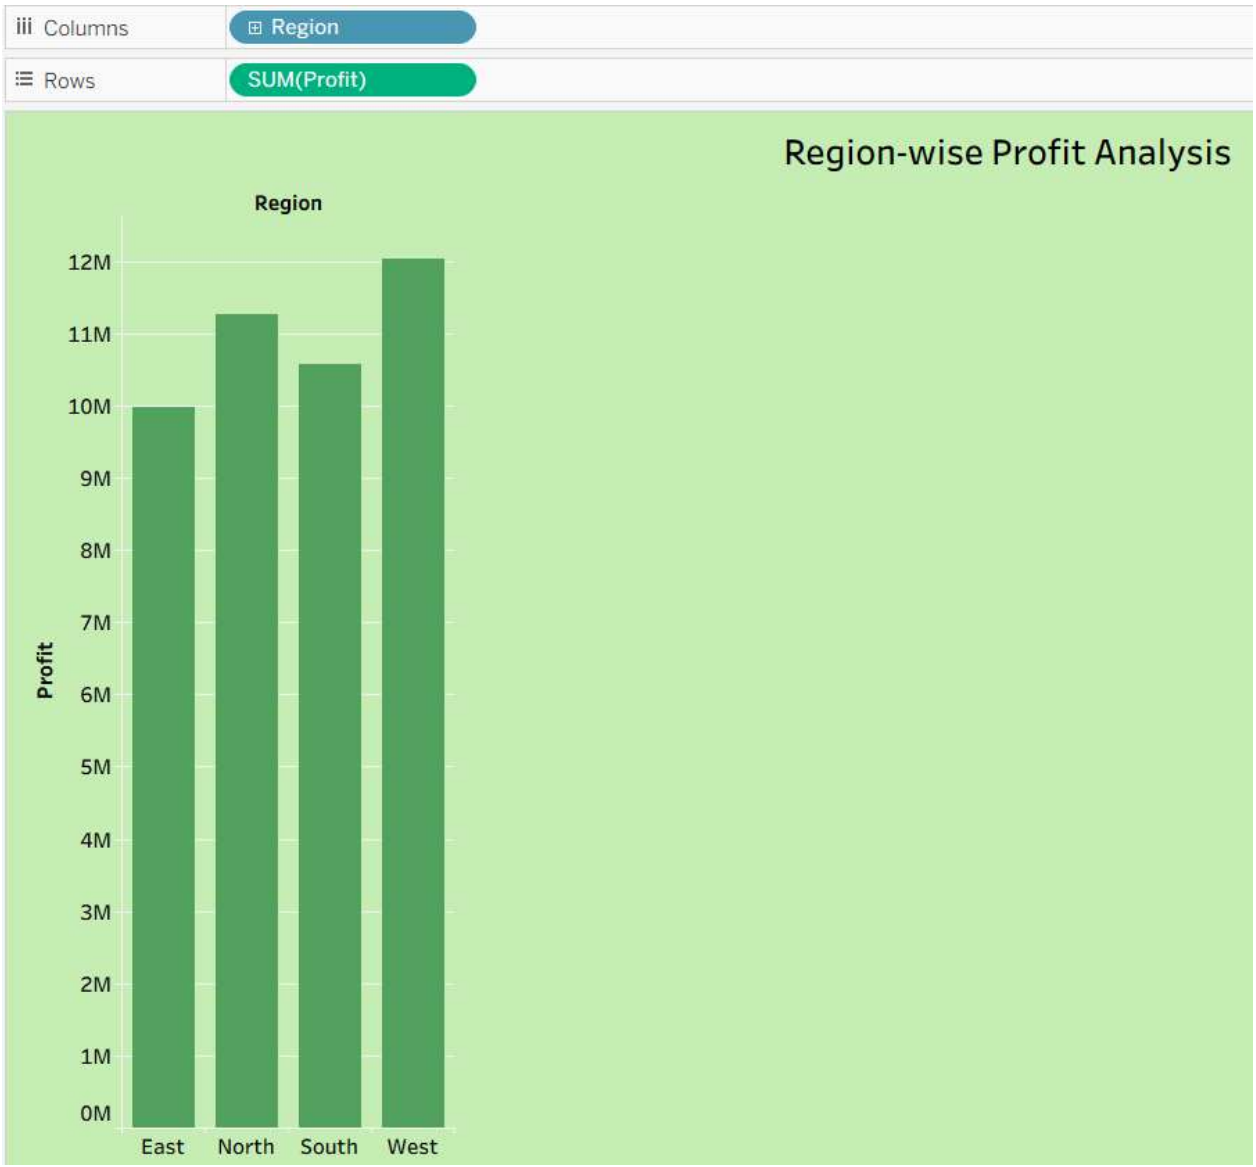
Top Salesperson Identification

The Top 2 Salespersons were identified based on Total Sales.
A **bar chart** was used to highlight the highest-performing individuals.



Region-wise Profit Analysis

A visualization was created to display **Total Profit by Region** using a bar chart.
This helps in identifying which regions are generating higher profits.

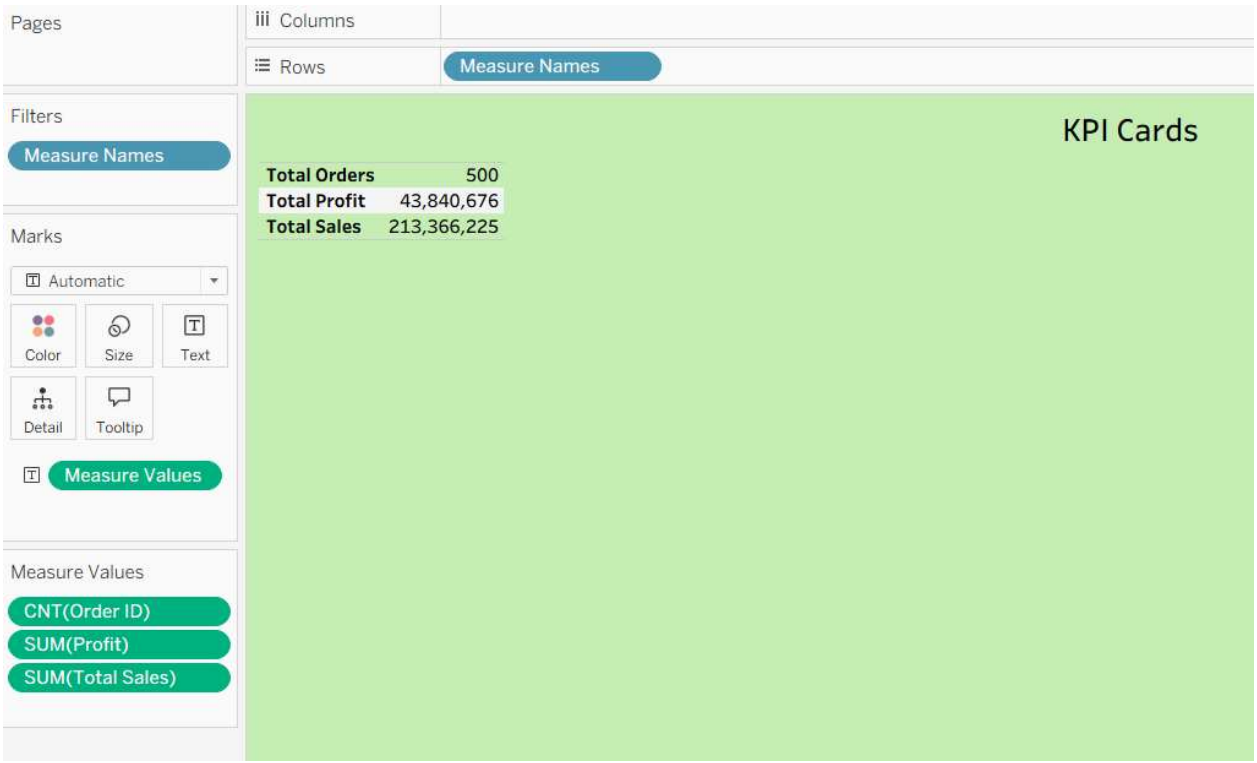


KPI Cards

A KPI card was created:

1. Total Orders
2. Total Sales
3. Total Profit

These KPI provide a quick summary of overall business performance.



Hierarchical Sales Analysis

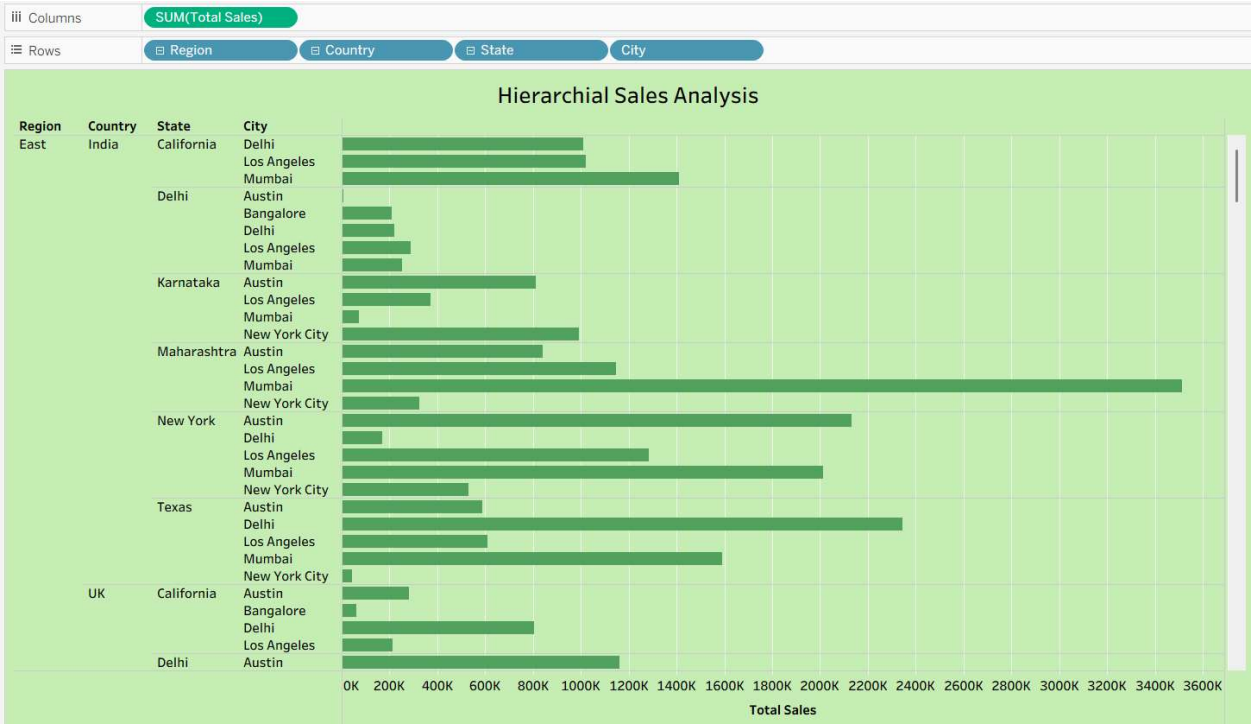
A hierarchy was created in the following order:

Region → Country → State → City

A visualization was built to display Total Sales using this hierarchy with:

- Drill-down functionality
- Drill-up functionality

This enables detailed analysis at multiple levels.



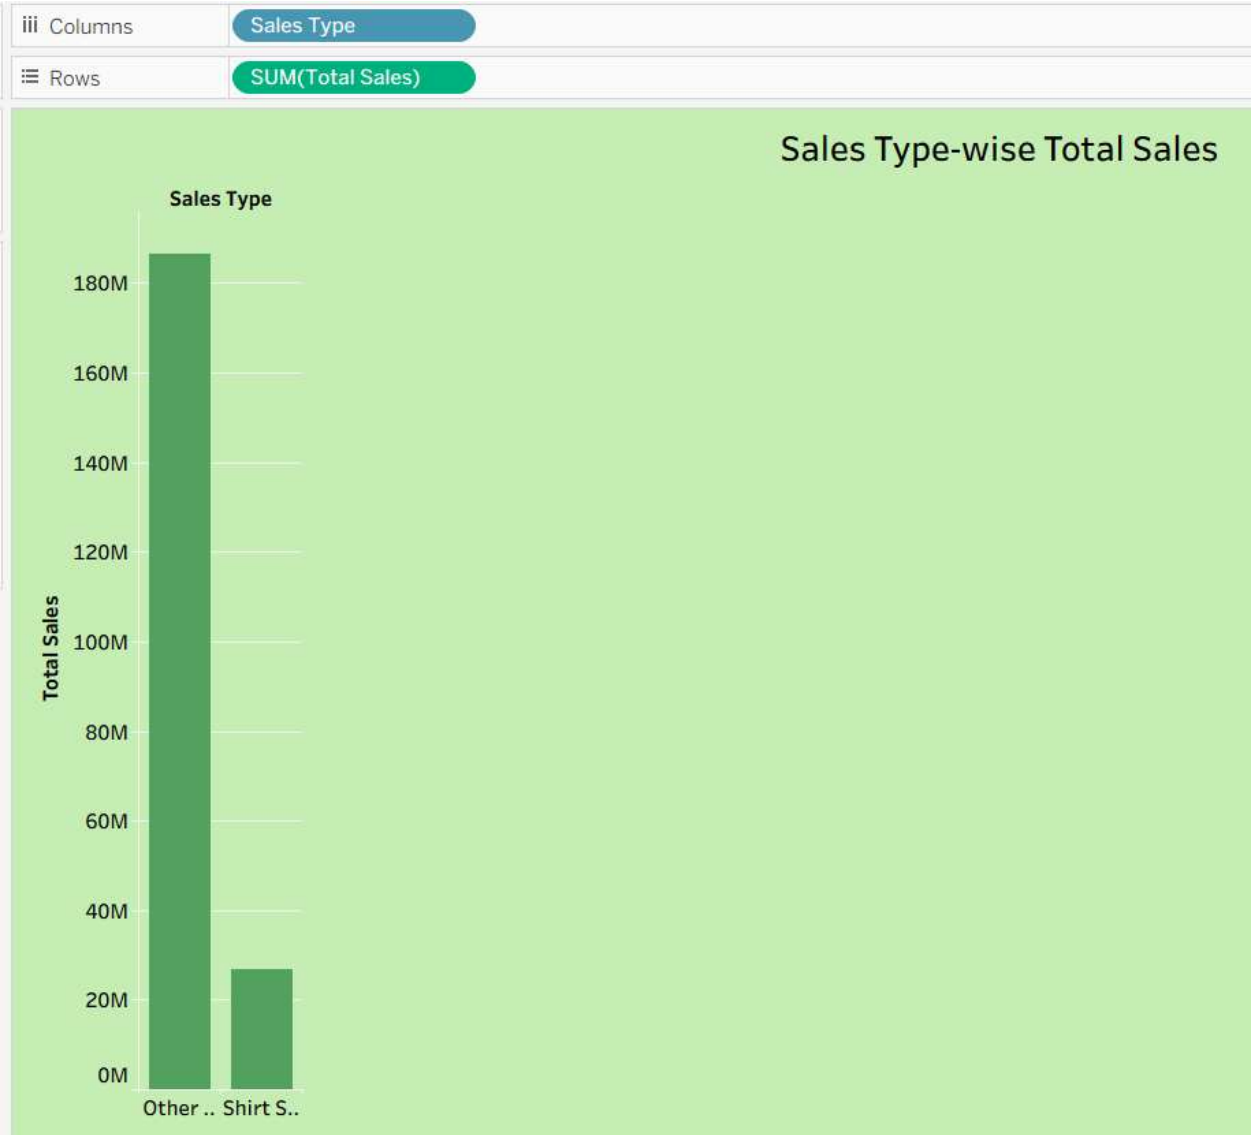
Conditional Logic & Visualization

A calculated field was created using an IF condition:

```
IF [Category] = "Clothing" AND [Sub-Category] = "Shirt" THEN "Shirt
Sale"
ELSE "Other Sale"
END
```

A visualization was created to show Total Sales based on:

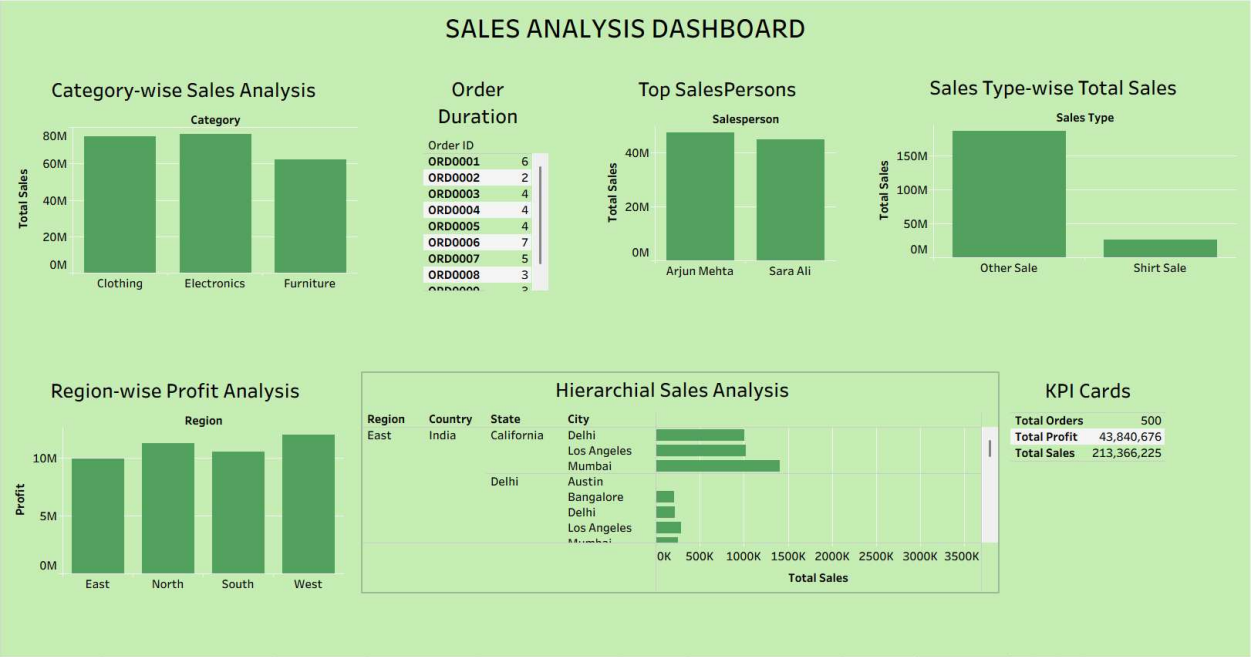
- Shirt Sale
- Other Sale



Key Insights

- Certain categories contribute significantly more to total sales.
- A small number of salespeople generate the highest revenue.
- Some regions are more profitable than others.
- Shirt sales form a distinct portion of total clothing sales.
- Order processing time varies across orders.

SALES PERFORMANCE DASHBOARD



Conclusion

The Sales Performance Dashboard successfully transforms raw sales data into meaningful insights using Tableau. By applying calculated fields, interactive visualizations, and hierarchical analysis, the dashboard supports effective business decision-making. This project demonstrates practical skills in data visualization, data analysis, and dashboard design using Tableau.
